Original: English

# DRAFT RECOMMENDATION BY ICCAT ESTABLISHING A MANAGEMENT PROCEDURE FOR ATLANTIC BLUEFIN TUNA TO BE USED FOR BOTH THE WESTERN ATLANTIC AND EASTERN ATLANTIC AND MEDITERRANEAN MANAGEMENT AREAS

(Panel 2 Chair's Proposal - PA2-613 - revised by the European Union)

*NOTING* that the objective of the Convention is to maintain populations of tuna and tuna-like species at levels that will support maximum sustainable catch (usually referred to as Maximum Sustainable Yield (MSY));

*RECALLING* that the Commission often had difficulties in deciding the total allowable catch (TAC) based on advice from the SCRS;

ALSO RECALLING that the SCRS had difficulties in providing robust scientific advice to the Commission due to various uncertainties such as the low quality of data;

*RECOGNIZING that* Harvest Control Rules (HCRs) and Management Procedures (MPs) developed using Management Strategy Evaluation (MSE) provides a more robust management framework than that based on a conventional stock assessment, ensuring a more precautionary approach and better stability of TACs;

ALSO RECOGNIZING the intent of the Commission to adopt HCRs and MPs developed using MSE, as established in Recommendation by ICCAT on the development of harvest control rules and of management strategy evaluation (Rec. 15-07);

*NOTING* the *Resolution by ICCAT on Developing Initial Management Objectives for Eastern and Western Bluefin Tuna* [Res. 18-03], which outlined the conceptual objectives for the Atlantic bluefin tuna MSE;

*RECALLING* that the Commission requested the SCRS to continue testing various candidate MP in 2022 and to meet with Panel 2 to review the results and support the panel in selecting one to adopt and apply for 2023 as in Rec. 21-07 and Rec. 21-08 and for this purpose Panel 2 held four intersessional meetings in 2022;

*STRESSING* the importance that all the stakeholders are involved in the MSE process since the MP automatically calculates the TAC to be adopted by the Commission unless it encountered an exceptional circumstance that is not envisaged by the MP;

*APPRECIATING* the efforts of all the scientists involved in the MSE process who made tremendous contribution not only to the scientific work but also to better communication of the results to various stakeholders involved in the bluefin tuna fisheries, including through informal ambassador meetings in three languages;

*NOTING* the importance of establishing an exceptional circumstances protocol in 2023 that would result in suspending or modifying the application of the MP; <u>and</u>

*RECOGNIZING* that, without prejudice to the interim application of the MP over the first management cycle, further analysis by SCRS is needed to explore the implications on MP performances of asymmetric management objective on Stock Status between Western and Eastern areas:

## THE INTERNATIONAL COMMISSION FOR THE CONSERVATION OF ATLANTIC TUNAS (ICCAT) RECOMMENDS THAT:

#### PART I GENERAL PROVISIONS

1. Contracting Parties and Cooperating non-Contracting Parties, Entities or Fishing Entities (CPCs) whose vessels fish for Atlantic bluefin tuna (*Thunnus thynnus*) in the Convention area shall implement the following management procedure (MP) ad interim. This MP shall be used to calculate the TAC for both the western Atlantic management area (hereafter called "the western management area") and the eastern Atlantic and the Mediterranean management area (hereafter called "the eastern management area").

#### **Management Objectives**

- 2. The management objectives for Atlantic bluefin tuna are:
  - (a) Stock Status:
    - Both the western and eastern stocks should have a greater than 65% probability of occurring in the green quadrant of the Kobe plot (not overfishing and not overfished) in 2052;
  - (b) Safety:
- There should be a less than 15% probability of either stock falling below B<sub>LIM</sub><sup>1</sup> at any point during years 2033 through 2052;
- (c) Yield:
- Maximize overall catch levels in both western and eastern management areas; and,
- (d) Stability:
  - Any change in TAC between consecutive management periods in both the western and the eastern management areas should be no more than a 20% increase or a 30% decrease.

### PART II MANAGEMENT PROCEDURE AND CATCH LIMITS

3. The <u>BR</u> management procedure has been selected and is fully described in **Annex 1**.

#### **Total Allowable Catch Setting**

- 4. The first TACs derived from the MP shall apply in 202<u>3</u>, 202<u>4</u>, and 202<u>5</u>. The management cycle length shall be three years; therefore, the MP shall be applied every three years.
- 5. Notwithstanding the stability management objective in paragraph 2d, there will be a phase-in period of <u>one</u> management cyc<u>le</u> where decreases in TAC shall be no more than 10%.
- 6. According to the timeline set out in **Annex 2**, the SCRS shall run the MP specified in **Annex 1** and advise the Commission of the resulting TAC for both the western management area and the eastern management area.
- 7. The Commission shall then adopt the TACs based on the outcome of the MP, unless the SCRS identifies exceptional circumstances that require consideration of alternative management actions to be taken by the Commission.

 $<sup>^1</sup>$  For the purposes of this bluefin tuna MSE, the Commission has agreed to use a  $B_{\text{LIM}}$  of 40% of the dynamic spawning stock biomass at maximum sustainable yield.

8. The SCRS shall assess the occurrence of exceptional circumstances annually and the Commission shall act in accordance with the exceptional circumstances protocol based on scientific advice by the SCRS and adopted by the Commission.

#### **TAC Implementation**

9. As the MP is run and adopted according to the determined schedule and procedure, the eastern and western management area TACs shall be implemented and monitored according to the provisions set out in the respective eastern and western management area Recommendations.

#### PART III FINAL PROVISIONS

10. A review of the performance of the MP, by the Commission and the SCRS, is to be completed by 2028 and every 6 years thereafter. The aim of the review is to ensure the MP is performing as expected. The review should determine whether the conditions allow continuing the application of the MP unchanged or whether there are conditions that warrant reconditioning the operating models; retuning the existing MP; and/or, consideration of alternate candidate management procedures or a new full management strategy evaluation, which would then need to be completed by the review completion date (i.e., 2028 and every 6 years thereafter).

10bis. Notwithstanding paragraph 10 above, the SCRS should undertake, during 2023-2025, the following analyses to:

- (a) test and compare the MP performance under the scenario where the probability to be in the green zone of the Kobe plot is 60% for the Western area and 65% for the Eastern area. The other management objectives and conditions shall remain as indicated in this Recommendation;
- (b) <u>updated indices on an annual basis until 2025 and evaluate whether warrant reconditioning of the operating models and retuning of the MP adopted by this Recommendation including also the PGK scenario stipulated in subparagraph (a) above.</u>
- (c) evaluate possible implications that the asymmetric scenario of the 60% West and 65% East PGK would have had on the performance of the previously rejected CMPs and on the dynamics of the decision-making process.
- 10ter. When advising the Commission on the results of the testing requested in paragraphs 10bis (a) and (b) the SCRS shall provide performance statistics to support decision-making in accordance with the performance indicators used for the development of the MP adopted by this Recommendation.
- 10quater. In 2025, the Commission should consider if any revision of it is needed taking into account any analyses carried out by the SCRS in accordance with paragraphs 10bis and 10ter and review the MP established by this Recommendation if necessary.
- 10quinquies. In 2025, the Commission shall adopt a 3-year constant annual TAC for the period 2026-2028, with possible separate application for the Eastern and Western Areas based on the application of the current MP or, where applicable, based on an amended MP pursuant to paragraph 10bis. The adoption of TAC shall be without prejudice to any other action required in accordance with the Exceptional Circumstances Protocol as set out in paragraph 11.
- 11. Panel 2, with scientific guidance from the SCRS, shall develop the exceptional circumstances protocol for this MP, for review and adoption at the 2023 annual Commission meeting. The protocol will become **Annex Y** of this recommendation once adopted. The SCRS shall evaluate the number of indices that need to be available and the percentage, by which catch data are underreported, that which would trigger an occurrence of exceptional circumstance.
- 12. This Recommendation repeals and replaces *Resolution by ICCAT on development of initial management objectives for eastern and western bluefin tuna* (Res. 18-03).

### Description and formulae for calculating TACs for western Atlantic and eastern Atlantic and Mediterranean bluefin tuna management areas using the <u>BR</u> Management Procedure

The BR CMP is empirical, based on inputs related to abundance indices which are first standardised for magnitude, then aggregated by way of a weighted average of all indices available for the East or for the West areas as appropriate (**Table A1**, 5 indices in each management area), and finally smoothed over years to reduce observation error variability effects. TACs are then set based on the concept of taking a fixed proportion of the abundance present, as indicated by these aggregated and smoothed abundance indices.

#### Aggregate abundance indices

An aggregate abundance index is developed for each of the East and the West areas by first standardising each index available for that area to an average value of 1 over the past years for which the index appeared reasonably stable, and then taking a weighted average of the results for each index, where the weight is inversely proportional to the variance<sup>2</sup> of the residuals used to generate future values of that index in the future modified to take into account the loss of information content as a result of autocorrelation. The mathematical details are as follows.

The indices,  $I_y^i$ , are first standardised to an average value of 1 over the past years for which the index appeared reasonably stable:

$$I_{y}^{i*} = \frac{I_{y}^{i}}{\sum_{y_{1}^{i}}^{y_{2}^{i}} I_{y}^{i} / (y_{2}^{i} - y_{1}^{i} + 1)}$$
(A1)

where  $y_1^i$  and  $y_2^i$  specify the period to which each index (i) is standardised (**Table A1**).

 $J_{\nu}^{E/W}$  is an average index over n series (n=5 for the East area and n=5 for the West area):

$$J_y^{E/W} = \frac{\sum_i^n w_i \times I_y^{i*}}{\sum_i^n w_i} \tag{A2}$$

where  $w_i = \frac{1}{\sqrt{\sigma^i}}$  (i.e., effective inverse variance to the power ¼ weighting).  $\sigma^i$  is computed as  $\sigma^i = \frac{SD^i}{1-AC^i}$ , where  $SD^i$  is the standard deviation of the residuals in log space and ACi is their autocorrelation, averaged over the OMs, as used for generating future pseudo-data. **Table A1** lists these values for  $w_i$ .

For the West, the weights computed above for US\_RR\_66\_144, JPN\_LL\_West2 and CAN\_SWNS have been multiplied by 3 (i.e.,  $w_i \rightarrow 3w_i$ ). This change has been implemented to avoid a steep drop in the median TAC for the West area during the 2030s.

In case of a missing index value in year y,  $J_y^{E/W}$ , is computed by setting  $w_i$  to zero, i.e., that index is disregarded when averaging over indices for that year only.

The actual index used in the CMPs,  $J_{av,y-2}^{E/W}$ , is the average over the last three years for which data would be available at the time the MP would be applied, hence:

$$J_{av,y-2}^{E/W} = \frac{1}{3} \left( J_{y-2}^{E/W} + J_{y-3}^{E/W} + J_{y-4}^{E/W} \right) \tag{A3}$$

where the  $J_{av,y-2}^{E/W}$  applies either to the East or to the West area.

<sup>&</sup>lt;sup>2</sup> This is modified somewhat in a few cases to provide the smoother TAC trend over time., as explained further below.

#### CMP specifications

The BR Fixed Proportion CMP variants set the TAC (in mt) every management cycle simply as a multiple of the  $J_{av}$  value for the area at the time (**Figure A1**), but subject to the change in the TAC for each area being restricted to a maximum of 20% up and 30% down (10% down for the phase-in period, and 35% down only for PGK 60% with a 3-year management cycle).

For the East area:

$$TAC_{E,y} = \begin{cases} \left(\frac{35032.31}{J_{2017}^{E}}\right) \cdot \alpha_{y} \cdot J_{av,y-2}^{E} & \text{for } J_{av,y-2}^{E} \ge T^{E} \\ \left(\frac{35032.31}{J_{2017}^{E}}\right) \cdot \alpha_{y} \cdot \frac{\left(J_{av,y-2}^{E}\right)^{2}}{T^{E}} & \text{for } J_{av,y-2}^{E} < T^{E} \end{cases}$$

$$\alpha_{y} = \begin{cases} \alpha_{0} + \Delta\alpha(y - 2021) & \text{for } 2021 \le y \le 2025 \\ \alpha_{0} + 4\Delta\alpha & \text{for } y > 2025 \end{cases}$$
(A4a)

For the West area:

$$TAC_{W,y} = \begin{cases} \left(\frac{2269.362}{J_{2017}^W}\right) \cdot \beta_y \cdot J_{av,y-2}^W & \text{for } J_{av,y-2}^W \ge T^W \\ \left(\frac{2269.362}{J_{2017}^W}\right) \cdot \beta_y \cdot \frac{\left(J_{av,y-2}^W\right)^2}{T^W} & \text{for } J_{av,y-2}^W < T^W \end{cases}$$

$$\beta_y = \begin{cases} \beta_0 + \Delta\beta(y - 2021) & \text{for } 2021 \le y \le 2028 \\ \beta_0 + 7\Delta\beta & \text{for } y > 2028 \end{cases}$$
(A4b)

The values 35032.314 *mt* and 2269.362 *mt* used in equations A4a and b respectively are the ICCAT Task 1 catch by management area in 2020 as at April 2022.

Note that in equation (A4a), setting  $\alpha_y=1$  would amount to keeping the East area TAC the same as the corresponding catch in 2020 (as explained above) if the abundance indices stayed at their 2017 level. If  $\alpha_y$  or  $\beta_y>1$  harvesting would be more intensive than at that time, and for  $\alpha_y$  or  $\beta_y<1$  it would be less intensive.

Below T, the law is parabolic rather than linear at low abundance (i.e., below some threshold, so as to reduce the proportion taken by the fishery as abundance drops); this is to better enable resource recovery in the event of unintended depletion of the stock. For the BR CMP, the choices of  $T^E = 1$  and  $T^W = 1$  have been made.

Constraints on the extent of TAC increase and decrease

$$\Delta TAC^{E/W} = \frac{{}^{TAC_y^{E/W}}}{{}^{TAC_{y-1}^{E/W}}} \tag{A5}$$

with  $TAC_y^{E/W}$  from equation A4.  $\Delta TAC^{E/W}$  is then modified as follows:

$$\Delta TAC^{E/W'} = \exp\left(\ln(\Delta TAC^{E/W})VarCadj\right) \tag{A6}$$

with a control parameter, *VarCadj*, taken for the BR CMP to be 0.5. This parameter is introduced to reduce the magnitude of the TAC changes; the smaller the value of this parameter the smaller the TAC change.

 $\Delta TAC^{E/W'}$  is then constrained to a maximum of 20% up and 30% down ((or 35% if PGK 60% with a 3-year management cycle is chosen) and 10% down for the phase-in period<sup>3</sup>,

if 
$$\Delta TAC^{E/W'} > (1 + maxUp^{E/W})$$
 then  $\Delta TAC^{E/W'} = (1 + maxUp^{E/W})$ , or if  $\Delta TAC^{E/W'} < (1 - maxDown^{E/W})$  then  $\Delta TAC^{E/W'} = (1 - maxDown^{E/W})$ 

<sup>&</sup>lt;sup>3</sup> This is for two cycles if the cycle period is two years, but only one cycle if this period is three years.

The TAC is then computed as:

$$TAC_y^{E/W'} = TAC_{y-1}^{E/W} \cdot \Delta TAC^{E/W'}$$
(A7)

If minimum TAC change constraints are accepted, the following revisions to these TACs apply:

if 
$$|TAC_{y-1}^{E/W} - TAC_{y}^{E/W'}| < min\Delta TAC^{E/W}$$
 then 
$$TAC^{E/W''} = TAC_{y-1}^{E/W}$$
 (A8)

where values suggested for  $min\Delta TAC^{E/W}$  have been 100 mt for the West and 1000 mt for the East.

**Table A1**. The index periods  $y_1^i$  and  $y_2^i$  (equation A1).and  $w^i$  weights used when averaging over the indices to provide composite indices for the East and the West areas (equation A2).

East					West
